PROJECTS

To attribute the problem attribution in cyber warfare incidents — the detecting cyber attacks and fake news(prototype)

This project has two types of attacks from cyberspace such as Network Intrusion dataset and Information operations fake dataset. we used random forest algorithm for prediction but we wrongly predicted. so, we have used a combination of 3 different latest classifiers such as AdaBoost, XGBoost and Bagging classifiers.

Topaz: An integrated enterprise apprentice— the digital library for my college

This is my graduation project which aims to developing a computerized system to maintain all daily work of library. User friendly interface, fast access to database, less error, quick transaction are advantages.
